

Officials see no link between miscarriage risk and flu shots

February 28 2019, by Mike Stobbe

In this Feb. 7, 2018 file photo, a nurse prepares a flu shot at the Salvation Army in Atlanta. Health officials say further research has not found a miscarriage risk for women who get annual flu shots. Two years ago, a puzzling study found women who had miscarriages between 2010 and 2012 were more likely to have had back-to-back annual flu shots. Experts said other factors may have caused the miscarriages, but urged more research. But this week, Centers for Disease Control and Prevention officials said a larger and more rigorous study found no link over three subsequent flu seasons. (AP Photo/David Goldman, File)

Health officials say further research has not found a miscarriage risk for women who get annual flu shots.

Two years ago, a puzzling study found women who had miscarriages between 2010 and 2012 were more likely to have had back-to-back annual flu shots. So [experts](#) urged more research.

This week, Centers for Disease Control and Prevention officials said a larger and more rigorous study found no link over three subsequent flu seasons.

Meanwhile, the CDC raised a question about a new shingles vaccine. A preliminary study found two cases of a rare paralyzing condition among more than 100,000 people who got a Shingrix shot. But one of the two may have started developing symptoms before the shot. Officials say they're doing more research.
