

Tecentriq approved for small cell lung cancer

March 19 2019

(HealthDay)—Tecentriq (atezolizumab) has been approved by the U.S. Food and Drug Administration to treat adults with extensive-stage small cell lung cancer (ES-SCLC).

The drug has been approved as a first-line treatment for the disease, to be used in combination with the [chemotherapy drugs](#) carboplatin and etoposide.

Tecentriq was evaluated in a clinical study involving 403 adults who had received no prior chemotherapy, the FDA said in a news release.

Average survival for those who took the Tecentriq combination was 12.3 months, compared to 10.3 months among those who took the chemotherapy drugs and a placebo.

The most common side effects among the Tecentriq group were fatigue, nausea, temporary baldness, constipation and loss of appetite.

The newly approved [drug](#) is produced by Genentech, based in South San Francisco.
