

Is your child addicted to screens? Here's what you can do about it

July 18 2019, by Jackson A. Smith And Dillon Thomas Browne

Luke's parents gave him a cell phone last year for his 10th birthday. Since then, the amount of time he spends playing video games on and off his phone has increased.

Luke has gained weight and recently started refusing to play on his sports team after school, preferring to stay home and interact with peers online. His grades at school have also declined. Recently, Luke and his younger brother got into a physical fight after Luke's brother "killed" his character in a first-person shooter game.

With summer break in full swing, parents like Luke's are concerned about their [children](#) spending more and more time on their devices. They are worried about how this might affect their child's health. They wonder when (and if) they should draw the line. They often ask us, as psychology researchers and clinicians, "is my child addicted to screens?"

A few important considerations emerge in response to this question.

Addictions are not limited to drugs

The term [addiction](#) is often characterized by a recurring desire to continue to take a substance [despite harmful consequences](#).

While the term addiction has traditionally been used in relation to substances such as alcohol and drugs, non-substance addictions—including [behavioural addictions such as sex, gambling and "video gaming"](#)—are now recognized.

When someone is addicted, the source of their addiction becomes their priority. Other important life activities (for instance sleeping, eating and bathing) are neglected. Interests such as playing soccer or spending time with family and friends fall by the wayside.

And when the source of the addiction is cut off, this triggers intense, negative, emotional reactions.

A teenager can have an addiction

Typically, behavioural addictions do not apply to children under the age of 12 years. This is because the principle of addiction implies two important factors. First, the person has insight into the problematic nature of their use, requiring a sophisticated capacity for self-reflection. Second, the person must have the cognitive maturity and capacity to be expected to inhibit their behavioural responses.

Stated differently, we would expect [young children](#) to have meltdowns in response to turning off a device and thus would not describe this as indicative of addiction.

However, if a young person with more developed capacity for reflection and self-regulation responded the same way, such as a 16-year-old, it means something very different.

Screen addiction is complex

According to the World Health Organization and many independent [clinical scientists](#), human beings can be addicted to screens. ["Gaming disorder" was introduced into the 11th revision of the International Classification of Diseases](#), in 2018.

Other prominent researchers have [argued that digital addiction is a myth](#). However, as clinicians it is our ethical obligation to take parents' and children's concerns seriously when they present at the clinic with worries about problematic media use.

The issue of being addicted to screens is complicated. First, the term "addiction" is loaded and is off-putting for some. There are also many sources of screens (smartphone, tablet, laptop, television), many types of

media (social media, TV shows, games) and many ways to use them (active or passive, solitary or social).

Addiction is also an extreme form of dependence and the term should not be used lightly. A comprehensive understanding of an individual's context, behaviours and the consequences of their actions is needed.

Research into what makes some people more susceptible to addictions shows there are [many possible pathways, including genetic and socio-relational factors such as stress](#). It is important to remember, however, that an increased risk for addiction does not mean that one is destined to become addicted. Many individual, social and environmental factors can protect an individual from developing an addiction.

Recommended screen-time limits

The Canadian Paediatric Society recently published guidelines for promoting healthy screen use. Whereas their [2017 guidelines](#) focus on screen time for children under the age of five, these new [2019 guidelines](#) address this issue in school-aged children and adolescents.

The following limits on screen time are recommended for young children:

- No screen time for children younger than two years (except for video-calling with friends and family).
- Less than one hour per day of routine or regular screen time for children two to five years old.
- Avoid screens for at least one hour before bedtime.
- Maintain daily "screen-free" times, especially for family meals and reading books.

Research on the impacts of screen time in older children and adolescents

is still developing. Therefore, the guidelines for school-aged children focus less on time limits and more on curating healthier engagement with digital media, but [low to moderate screen time \(under four hours per day\) is encouraged](#).

What you can do as a parent

The Canadian Paediatric Society's 2019 guidelines include helpful recommendations for parents:

1. Manage screen use. You can achieve this by creating a [family media plan](#) with individualized time and content limits and learning about [parental controls and privacy settings](#). Other tips include co-viewing and talking about content with your children, discouraging use of multiple devices at once, obtaining all passwords and log-in information and discussing appropriate online behaviours.

2. Encourage meaningful screen use. This involves prioritizing daily (non-screen) routines over screen use and helping children and teens to choose age-appropriate content and to recognize problematic content or behaviours. You can become part of your children's media lives and advocate for schools and child-care programs to consider developing their own plan for digital literacy and screen use.

3. Model healthy screen use. Review your own media habits and plan time for alternative play and activities. Encourage daily "screen-free" times. Turn off your own screens when they are not in use (including background TV). Avoid screens at least one hour before bedtime and discourage recreational screen use in bedrooms.

4. Monitor for signs of problematic use. These signs include: complaints about being bored or unhappy without access to technology and oppositional behaviour in response to screen-time limits. Screen use

that interferes with sleep, school, face-to-face interactions, offline play and physical activities is also problematic, as are negative emotions following online interactions.

Integrate screens mindfully

We are fortunate to live in a [time](#) of such rapid technological innovation. These technologies open up tremendous opportunities for most (if not all) domains of life, including new and different opportunities for families to connect, engage and bond.

But we do need to be mindful of how we integrate these technologies into our lives and of the consequences they have on ourselves, our relationships and our children.

If you are concerned about digital media use in your family, we recommend that you develop a [family media plan](#). You can also see your family physician or a clinical psychologist to discuss your concerns.
