

Lower back pain? Self-administered acupressure could help: study

August 21 2019

A recent study finds that acupressure, a traditional Chinese medicine technique, can improve chronic pain symptoms in the lower back.

"Acupressure is similar to acupuncture, but instead of needles, pressure is applied with a finger, thumb or device to specific points on the body," says Susan Murphy, ScD, OTR, an associate professor of physical

[medicine](#) and rehabilitation at Michigan Medicine and lead author of the study.

Murphy says that while [acupressure](#) has been previously studied—and found to be beneficial—in people with [cancer-related](#) or [osteoarthritis pain](#), there are few studies that have examined acupressure in people with back pain.

In the study, published in *Pain Medicine*, the research team randomly assigned 67 participants with [chronic low back pain](#) into three groups: relaxing acupressure, stimulating acupressure or usual care.

"Relaxing acupressure is thought to be effective in reducing insomnia, while stimulating acupressure is thought to be effective in fatigue reduction," Murphy says.

Participants in the acupressure groups were trained to administer acupressure on certain points of the body, and spent between 27 and 30 minutes daily, over the course of six weeks, performing the technique.

Participants in the usual care group were asked to continue whatever treatments they were currently receiving from their care providers to manage their back pain and fatigue.

"Compared to the usual care group, we found that people who performed stimulating acupressure experienced pain and fatigue improvement and those that performed relaxing acupressure felt their pain had improved after six weeks," Murphy says.

"We found no differences among the groups in terms of sleep quality or disability after the six weeks."

Potential treatment option

Murphy notes that chronic pain is difficult to manage and people with the condition tend to have additional symptoms such as [fatigue](#), sleep disturbance and depression.

"Better treatments are needed for chronic pain," Murphy says. "Most treatments offered are medications, which have side effects, and in some cases, may increase the risk of abuse and addiction."

She says this study highlights the benefits of a non-pharmacological treatment option that patients could perform easily on their own and see positive results.

"Although larger studies are needed, acupressure may be a useful [pain](#) management strategy given that it is low risk, low cost and easy to administer," Murphy says.

"We also recommend additional studies into the different types of acupressure and how they could more specifically be targeted to patients based on their symptoms."
