

# Routine screening for pancreatic cancer not warranted, expert panel says

August 6 2019

---

(HealthDay)—There's nothing to be gained by screening for pancreatic

cancer in people with no signs or symptoms of the lethal tumor, according to an influential U.S. panel of experts.

Looking over the accumulated data on the subject, the U.S. Preventive Services Task Force (USPSTF) on Tuesday reaffirmed its prior recommendation against routine screening for [pancreatic cancer](#).

The USPSTF is an independent, volunteer panel of national experts in prevention and evidence-based medicine.

"Pancreatic cancer is an uncommon, but devastating disease with low survival rates, even in those detected at [early stages](#)," [task force](#) member Dr. Chyke Doubeni, noted in a USPSTF statement.

However, "at the present time, screening for pancreatic cancer in people without any signs or symptoms would cause more harm than good and therefore should not be done," he added.

According to the USPSTF, there's no evidence that screening for pancreatic cancer improves patient outcomes. In addition, some [screening tests](#) are invasive and can be painful and possibly inaccurate. They can also damage the pancreas.

If cancer *is* found, surgery to remove the organ can result in significant bleeding, long recovery and possibly death, the task force also noted.

The trouble is that tumors of the pancreas are often discovered late, making the cancer a "silent killer." According to the American Cancer Society, about 57,000 Americans will be diagnosed with the disease in 2019, and almost 46,000 people will die from the illness.

Better screens are needed for early detection.

Task force member Dr. Chien-Wen Tseng said in the statement that "clinicians need to be able to find pancreatic cancer earlier in its development, when it is more treatable. The task force is calling for more research on effective and accurate screening tests that can detect pancreatic cancer earlier and that lead to fewer harms."

According to Dr. Sanjay Reddy, a cancer expert unconnected to the USPSTF, "The role of 'biomarkers,' or some sort of chemical blood test has the most promise in terms of early detection." Reddy is assistant professor of surgical oncology at Fox Chase Cancer Center in Philadelphia.

"However," he added, "to date, we still have no good way to test this—the future of [early detection](#) remains our best option for screening not only high-risk patients, but all patients."

The panel stressed that screening for pancreatic cancer may still be warranted for people deemed to be at high risk for the disease.
