

CDC: number of vaping-linked lung illnesses up to 2,172

November 18 2019

The number of Americans stricken with a severe respiratory illness tied

to vaping has now reached 2,172, the U.S. Centers for Disease Control and Prevention reported Thursday. That is a rise from the 2,051 case total from a week ago.

Cases have now been reported in every state except Alaska, the agency noted. The related death toll has also risen by three over the past week, to 42 fatalities spread across 24 states and the District of Columbia. Deaths have involved patients ranging from the ages of 17 to 75 years, with a median age of 52. Young men are being especially affected, with 70 percent of patients being male and 79 percent younger than 35 years.

The CDC has noted that approximately 85 percent of cases involved products that contained tetrahydrocannabinol. And just last week, a federal report pointed to vitamin E acetate as the likely culprit behind these severe lung illnesses.

In related news, Apple said Friday that it has removed 181 vaping-related apps from its mobile App Store worldwide. The company said the now-banned apps—a mix of stores, social networks, news, and games—will continue to work for people who already have them and can be transferred to new devices, *CNN* reported. In June, Apple halted the promotion of vaping products in its App Store and has not approved any new vaping-related apps since then.
