

A happy partner leads to a healthier future

February 11 2020

Having an optimistic partner can help stave off poor health -- both physical and mental. Credit: Jamie Street on Unsplash

Science now supports the saying, "happy wife, happy life." Michigan State University research found that those who are optimistic contribute

to the health of their partners, staving off the risk factors leading to Alzheimer's disease, dementia and cognitive decline as they grow old together.

"We spend a lot of time with our partners," said William Chopik, assistant professor of psychology and co-author of the study. "They might encourage us to exercise, eat healthier or remind us to take our medicine. When your partner is optimistic and healthy, it can translate to similar outcomes in your own life. You actually do experience a rosier future by living longer and staving off cognitive illnesses."

An optimistic partner may encourage eating a salad or work out together to develop healthier lifestyles. For example, if you quit smoking or start exercising, your partner is close to following suit within a few weeks and months.

"We found that when you look at the [risk factors](#) for what predicts things like Alzheimer's disease or dementia, a lot of them are things like living a healthy lifestyle," Chopik said. "Maintaining a healthy weight and physical activity are large predictors. There are some physiological markers as well. It looks like people who are married to optimists tend to score better on all of those metrics."

The study, published in the *Journal of Personality* and co-authored by MSU graduate student Jeewon Oh and Eric Kim, a research scientist in the Department of Social and Behavioral Sciences at the Harvard T.H. Chan School of Public Health, followed nearly 4,500 [heterosexual couples](#) from the Health and Retirement Study for up to eight years. The researchers found a potential link between being married to an optimistic person and preventing the onset of [cognitive decline](#), thanks to a healthier environment at home.

"There's a sense where optimists lead by example, and their partners

follow their lead," Chopik said. "While there's some research on people being jealous of their partner's good qualities or on having bad reactions to someone trying to control you, it is balanced with other research that shows being optimistic is associated with perceiving your relationship in a positive light."

The research also indicated that when couples recall shared experiences together, richer details from the memories emerge. A recent example, Chopik explained, was Google's tearjerker Super Bowl ad, "Loretta," in which an elderly man uses his Google Assistant to help him remember details about his late wife.

"The things he was recollecting were positive things about his partner," Chopik said. "There is science behind the Google ad. Part of the types of memories being recalled were positive aspects of their relationship and personalities."

With all of its benefits, is optimism something that can be prescribed? While there is a heritable component to optimism, Chopik says there is some evidence to suggest that it's a trainable quality.

"There are studies that show people have the power to change their personalities, as long as they engage in things that make them change," Chopik said. "Part of it is wanting to change. There are also intervention programs that suggest you can build up optimism."

Across the board, everyone benefits from a healthy dose of optimism from their partner. For the glass-is-half-empty people, a partner can still quench their thirst. For the glass-is-half-full people? Their cup runneth over.
