Have you ever been ready to head out the door but can't seem to remember where you put your keys? Or have you been standing in the grocery store trying to remember what else you need?

Most people have had their own bouts of forgetfulness. When is this

forgetfulness a concern or an indicator of something else going on?

According to the Alzheimer's Association, [memory loss](#) is one of the first signs of Alzheimer's disease. However, there are differences between occasional forgetfulness and memory loss linked to a bigger problem. Forgetting names or appointments but remembering them later is typically not cause for concern. A type of memory loss that can be a red flag is when someone repeatedly asks for the same information. Some signs seen alongside memory loss include difficulty to complete familiar tasks, confusion with time or place, changes in personality and losing the ability to retrace steps when something has been misplaced. Regardless of what category you think your [memory](#) loss or other [cognitive abilities](#) might fall into, if you have concerns in declines or changes it is always best to consult a [health care](#) professional.

Millions of Americans are living with Alzheimer's Disease or other dementias. As the size of the population age 65 and older continues to increase, the number of those impacted by Alzheimer's and other dementias is expected to grow rapidly. Projections by the U.S. Census Bureau show the population of Americans age 65 and older jumping from 55 million in 2019 up to 88 million by 2050. Current numbers from the Alzheimer's Association show that one in 10 people age 65 and older are living with Alzheimer's dementia.

Most experts agree that we may be able to find better treatments, and possibly cures for Alzheimer's disease and related disorders in the next decade, but only with the continued support of research participants. Several clinical research studies are going on at the University of Kentucky Sanders-Brown Center on Aging. This type of work is the only way we can hope to find cures for diseases such as Alzheimer's disease, and promote normal healthy brain aging for all.

More information: The center is looking for willing participants of all

genders, racial backgrounds and ethnicities. Participants can also vary from not having any memory or thinking problems to those that have some challenges. To discuss opportunities to get involved in brain aging research please contact me at (859) 323-1331 or shbardach@uky.edu.
