Treating obesity in children and adolescents improves self-esteem and body image, according to an analysis of all relevant studies published to date. The analysis, which is published in *Pediatric Obesity*, included 64

studies.

Losing weight appeared important for achieving improvements in [body image](#) but not [self-esteem](#).

"Our findings are encouraging as they show that pediatric obesity treatment can improve psychological as well as weight-related outcomes," said lead author Megan Gow, Ph.D., of the University of Sydney, in Australia.
