

Getting your protein from plants a recipe for longevity

July 13 2020, by Dennis Thompson, Healthday Reporter

(HealthDay)—Swapping out tofu for your morning eggs or using beans

instead of ground beef in your chili could help you live longer, a new study reports.

Getting your daily protein from plants instead of animals appears to reduce your overall risk of early death, researchers found.

Every 3% of a person's daily energy intake coming from plant protein instead of [animal protein](#) reduced a person's risk of premature death by 10%, the results showed.

The results were particularly strong when people swapped plant protein for eggs (24% [lower risk](#) in men and 21% lower risk in women) or red meat (13% lower risk in men, 15% in women).

Taking red meat out of your diet can be beneficial, but only if you swap for a healthy substitute, said lead researcher Jiaqi Huang, a postdoctoral fellow at the U.S. National Cancer Institute.

"For example, replacement of 3% energy from egg protein or red meat protein with plant protein such as whole grains or cereals resulted in a protective association for overall mortality," Huang said. "On the other hand, replacement of 3% energy from egg protein or red meat protein with other foods such as sugar-sweetened beverages may or may not result in a reduction in mortality."

For this study, Huang's team analyzed dietary data from more than 237,000 men and 179,000 women gathered between 1995 and 2011 as part of a long-term study on eating patterns and health.

Protein made up about 15% of people's daily diet, with 40% coming from [plants](#) and 60% from animals, the researchers found.

During 16 years of follow-up, a pattern emerged where plant protein

intake appeared to reduce risk of early death. Every 10 grams of plant-for-animal protein swapping per 1,000 calories resulted in a 12% lower risk of death for men and 14% for women, the findings showed.

According to senior researcher Dr. Demetrius Albanes, a senior investigator with the cancer institute, "Our data provide evidence to support the favorable role for plant-based diets in the prevention of cardiovascular disease mortality, and that modifications in choices of protein sources may influence health outcomes and longevity."

There are many reasons why choosing [plant protein](#) over animal protein could help extend your life, the researchers and experts said.

Meat protein tends to come with higher levels of saturated fat, cholesterol, sodium and other nutrients that aren't very good for your health, said Connie Diekman, a food and nutrition consultant in St. Louis and a past president of the Academy of Nutrition and Dietetics.

"For example, one ounce of [red meat](#) mixed with whole wheat pasta and veggies would provide much less saturated fat than a 9-ounce steak," Diekman said.

On the other hand, plant proteins come with loads of fiber, antioxidants, vitamins and minerals, said Kayla Jaeckel, a registered dietitian and diabetes care manager with Mount Sinai Health System in New York City.

The researchers also added that there might be something specific about the amino acids formed from the breakdown of animal-based protein that could cause arteries to grow harder or inflammation to occur.

Animal [protein](#) also could affect the health of people's gut bacteria.

One weakness of the study is that it relied on people's memories, as they

were asked to remember what they'd eaten and fill out a questionnaire, Diekman said.

"This provides a glimpse at diet intake but doesn't show patterns, and patterns are key," Diekman said. "Combining an egg with brown rice and veggies provides a very different nutrient intake than eggs, bacon, biscuits and gravy."

These findings also run counter to other recent studies that have shown eggs are healthier than folks believed for decades, Jaeckel said.

"I think eggs can be part of a healthy and balanced diet. I wouldn't want [eggs](#) to be painted in a negative light, because I feel like there's always been flip-flopping with them," Jaeckel added.

Diekman said, "My take on the study, and what I would tell clients, is that evidence continues to grow to support the importance of consuming more plant foods and less animal foods, while also boosting vegetable, whole grain and fruit intake. We can enjoy our favorite, heavy egg or meat dish but probably not every day, and preferably in balance with lots of plant foods."

The report was published online July 13 in *JAMA Internal Medicine*.
