

CDC: 20.4 percent of U.S. adults had chronic pain in 2019

November 4 2020

(HealthDay)—In 2019, more than 20 percent of U.S. adults reported

chronic pain in the last three months, according to a November data brief published by the U.S. Centers for Disease Control and Prevention National Center for Health Statistics.

Carla E. Zelaya, Ph.D., from the National Center for Health Statistics in Hyattsville, Maryland, and colleagues examined [chronic pain](#) and high-impact chronic pain in the previous three months among U.S. adults ages 18 years and older using data from the National Health Interview Survey.

The researchers found that 20.4 percent of adults had chronic pain in 2019, and 7.4 percent had chronic pain that frequently limited life or [work activities](#) (high-impact chronic pain) in the previous three [months](#). Chronic pain and high-impact chronic pain increased with age; the percentage of adults with chronic pain and high-impact chronic pain was highest for adults ages 65 years and older. The likelihood of having chronic pain was higher for non-Hispanic White adults versus non-Hispanic Black, Hispanic, and non-Hispanic Asian adults (23.6 percent versus 19.3, 13.0, and 6.8 percent, respectively). As place of residence became more rural, the percentage of adults with chronic pain and high-impact chronic pain increased.

"Chronic pain was highest among women (21.7 percent), non-Hispanic White adults (23.6 percent), and those aged 65 and over (30.8 percent)," the authors write. "High-impact chronic pain was highest among women (8.5 percent) and those aged 65 and over (11.8 percent)."
