

CDC investigating *Listeria* outbreak in four states

February 15 2021

Seven people in four states have been hospitalized in a *Listeria* outbreak

linked to potentially contaminated cheese, U.S. health officials said Friday.

Because *Listeria monocytogenes* can cause [severe illness](#), the U.S. Centers for Disease Control and Prevention is advising people at high risk for severe *Listeria* illness to not eat any Hispanic-style fresh and soft cheeses until more information is available.

People who are pregnant (and their newborns), adults aged 65 or older, and people with weakened immune systems, such as people with cancer or on dialysis, should avoid Hispanic-style fresh and soft cheeses (like queso fresco, queso blanco, and queso panela), until investigators identify the specific type or brand that is making people sick.

Symptoms of *Listeria* illness can include headache, stiff neck, confusion, loss of balance, and convulsions, in addition to fever and muscle aches, the CDC added. Symptoms of severe illness usually start one to four weeks after eating food contaminated with *Listeria*, but they can start the same day or as late as 70 days after, the agency noted.
