Many of the over 120,000 excess deaths Mexico suffered so far during the pandemic may have been indirectly caused by the coronavirus, even if those people didn't die of COVID-19, Mexican officials said Tuesday.

A "very significant part" of those deaths were people who were suffering [heart problems](#) but were too afraid to go the [hospital](#) for fear of getting infected, said Dr. Ruy López Ridaura, the country's director of disease prevention and control.

"Clearly, even those cases that aren't directly associated with (coronavirus) infection ... in some way are associated with the pandemic, right, because they were associated with the burden on hospitals, the fear that people had," López Ridaura said.

"It is not unreasonable to think that a very significant part is due to people not seeking medical attention," he said. "They were in a certain way afraid to go to a system that was caring for a lot of COVID patients, for [fear](#) of getting infected."

The number of deaths from [heart disease](#) and diabetes skyrocketed during 2020. For example, deaths from cardiac ailments increased 36% last year, as compared to 2019, and deaths from complications of diabetes were up 46%.

Fear may not have been the only factor. Many hospitals in Mexico simply did not have room for non-COVID-19 patients, or treatment may have been delayed because ambulances were tied up during the pandemic, or because some hospitals would not treat emergency patients until they had been tested for the [coronavirus](#).

Not including the indirect deaths, officials list 322,263 deaths directly caused by COVID-19.

While case numbers have been declining, Mexico recorded 807 test-confirmed deaths Tuesday, a relatively high number compared to recent weeks.

Mexico's toll rivals that of Brazil, which currently has the world's second-highest number of deaths after the United States. But Mexico's population of 126 million is considerably less than either of those countries.
