

Africa detecting just 1 in 7 COVID-19 cases, says WHO study

October 14 2021, by Sam Mednick

In this Wednesday, April 29, 2020 file photo, a resident from the Alexandra township gets tested for COVID-19 in Johannesburg, South Africa. According to a new study by the World Health Organization, only one in seven COVID-19 infections in Africa are being detected, meaning the continent's estimated infection level may be 59 million people, according to WHO's Africa regional director Matshidiso Moeti who addressed journalists Thursday Oct. 14, 2021. Only one in seven COVID-19 infections in Africa are being detected, meaning the continent's estimated infection level may be 59 million people, according to a new study by the World Health Organization.

"With limited testing, we're still flying blind in far too many communities in Africa," said Matshidiso Moeti, regional director for the WHO in Africa in a press briefing Thursday.

To get more accurate numbers of infections and to better curb transmission, the U.N. plans to increase rapid diagnostic testing in eight African countries with the goal of testing 7 million people in the next year.

The initiative is a "radically" new approach that shifts from passive to active surveillance by working with communities, said Moeti. The rapid tests are affordable, reliable and easy to use and will provide results within 15 minutes, she said. An additional 360,000 cases are expected to be detected by using the tests, with approximately 75% of them being asymptomatic or mild, she said.

The initiative will be based on what is called a ring strategy that has been used to eradicate smallpox and was implemented during Ebola outbreaks. It is called a ring method because it will target people living within a 100-meter (110-yard) radius around new confirmed cases.

Health professionals welcomed the approach and said it will help the continent to get ahead of the pandemic rather than playing catch up. Since the start of the outbreak, Africa has recorded more than 8 million COVID-19 cases and 214,000 deaths, according to the Africa Centers for Disease Control and Prevention.

The rapid testing will also provide officials with data to help avoid overwhelming health systems and implementing restrictions that can be

"disastrous as far as economic consequences," said Ngozi Erondy, senior scholar at Georgetown University's O'Neill Institute.

However, the U.N. warned that with Africa having millions of undetected cases it is urgent to speed up the continent's access to vaccines, which have been too slow to arrive. Africa's vaccination rates are low. Only 30% of the continent's 54 countries having fully vaccinated 10% of their populations while many high-income countries have achieved vaccination rates of almost 90%, according to the U.N.

With the approach of end-of-year travel that is expected to cause a surge in cases, Moeti said African countries should prepare for a possible fourth wave. She urged wealthy countries to share a significant number of doses with Africa right now rather than wait until next year.
