

New technique to teach the immune system not to attack lifesaving treatments

November 29 2021, by Sathy Balu-Iyer

Biophysical characteristics of lipid nanoparticles for immunotherapy. (a) Surface exposure of different PS species on the nanoparticles as detected by PSVue fluorescence signal. Changes in fluorescence intensity I/I_0 were monitored as a function of total lipid concentration and fitted in GraphPad Prism using a single site-total binding model with nonlinear least squares fitting. Data are represented as mean \pm SD. Two-way ANOVA followed by Tukey's post-hoc analysis was performed to detect statistical significance, *P
