

Vaccinated health care workers shed less COVID-19 virus than unvaccinated

November 18 2021

(HealthDay)—Vaccinated health care workers with breakthrough

COVID-19 infections shed less virus than those who are unvaccinated and infected, according to University of California, Los Angeles researchers.

"SARS-CoV-2 viral loads are known to be a critical driver of transmission," wrote authors led by Dr. Paul Adamson, an assistant professor of medicine in the division of infectious diseases. "Thus, our findings using real-world data suggest that COVID-19 vaccination might translate into decreased transmissibility of SARS-CoV-2 infections."

For the new study, the researchers analyzed data on 880 UCLA [health care workers](#) who tested positive for COVID [infection](#) between Dec. 16, 2020—when vaccines first became available at the university—and March 31, 2021.

Seventy percent of the infections were among unvaccinated workers, compared with 30% of those who had received at least one [vaccine](#) dose.

More virus was found in samples taken from infected workers who had not yet been vaccinated than in those from infected employees who had received any of three vaccines used in the United States. Those who had received both doses of mRNA vaccines had the lowest amounts of virus, according to findings.

The study was published Nov. 17 in the journal *Open Forum Infectious Diseases*.

The research was conducted before the recent Delta variant surge, but its findings are consistent with other research showing that the spread of COVID-19 is lower among vaccinated people, according to Adamson.

"These findings should be reassuring for the general public because lower amounts of virus might translate to decreased transmissibility," he

said in a university news release.

"This is another benefit of the vaccines and yet another reason to get vaccinated against COVID-19," Adamson added. "The Delta variant has been shown to contain higher amounts of [virus](#) than that of prior variants, though recent data also show that vaccinated individuals still clear infections with Delta variant quicker and have a more [rapid decline](#) in viral loads."
