

# Report highlights characteristics of Omicron SARS-CoV-2 variant in U.S.

December 14 2021

---

(HealthDay)—Surveillance and characteristics of the severe acute

respiratory syndrome coronavirus 2 (SARS-CoV-2) omicron variant are described in a report published in the Dec. 10 early-release issue of the U.S. Centers for Disease Control and Prevention *Morbidity and Mortality Weekly Report*.

Researchers from the CDC COVID-19 Response Team summarized U.S. surveillance for SARS-CoV-2 variants, characteristics of the initial persons with COVID-19 attributed to the [omicron variant](#), and public health measures instituted to slow the spread of [omicron](#).

The researchers note that enhanced surveillance was initiated through the National SARS-CoV-2 Strain Surveillance on Nov. 28, 2021, to accelerate detection of COVID-19 cases attributed to the [omicron variant](#). The first U.S. case was identified on Dec. 1, 2021, and 22 states had reported cases as of Dec. 8, 2021. The earliest date of symptom onset was Nov. 15, 2021. Of the first 43 cases of COVID-19 attributed to the omicron variant, 58 percent were in persons aged 18 to 39 years. One-third (14 persons) reported international travel during the 14 days preceding symptom onset or positive test results. Seventy-nine percent of the COVID-19 cases attributed to the omicron variant occurred in persons who had completed the primary series of a U.S. Food and Drug Administration-authorized or approved COVID-19 vaccine 14 days or more prior to symptom onset or positive test result; 14 had received an additional or booster dose, including five who received the additional or booster dose
