

Young people's fear of missing out may be fuelling feelings of social disconnection during COVID-19

Most of us have spent more time on screens since the start of the COVID-19 pandemic. This increase in screen time may be especially

pronounced among teens because of school closures, the cancelation of extracurricular activities and restrictions on physical social interactions. This has led [both parents and resesarchers to worry that the pandemic is making young people addicted to their phones](#) and that this [increased screen time is contributing to feelings of social disconnection and isolation](#).

In a study produced [by our research team at the University of British Columbia](#), we found compelling evidence that [young people](#) don't see their [screen time](#) as an important factor contributing to their feelings of social disconnection.

Rather, most youth in our study reported that technology played a crucial role in helping them feel connected to others. However, the fear of missing out (FOMO) seems to be an important risk factor contributing to youth feelings of social disconnection.

Feeling socially connected during COVID-19

Our study collected data from 682 youth, aged 11–18, at two schools in Canada, using an online survey with questionnaires and open-ended questions.

We found that most youth (64 percent) reported feeling socially connected to others in the pandemic. This is important since extensive research has shown [that individuals who are satisfied in their connections to others typically have better physical and mental health, and tend to live longer](#). A recent study by psychology researcher [Natasha Magson and colleagues](#) found that feeling socially connected was central to teens' well-being during the pandemic.

Technology helping to maintain relationships

In our study, youth who described feeling socially connected to others emphasized the role of technology in fostering and maintaining their relationships with others. For example, an 11-year-old boy explained: "The only thing COVID changed was not being able to see my friends as much in real life and not being able to do sports. But through social media and playing video games I can still connect with my friends without actually seeing them."

For such young people, technologies such as FaceTime, social media and video games allowed them to keep in touch with their friends and helped them foster feelings of social connection.

Despite most youth reporting feeling socially connected to others, just under a third (28 percent) of respondents described feeling socially disconnected from others in the time of COVID-19. Feeling socially disconnected puts youth [at risk for life difficulties](#) like depression and loneliness.

Fear of missing out during COVID-19

We also found that [fear of missing out](#) played a unique and important role in contributing to young people's feelings of social disconnection.

Worries about missing out on things others have or do have been around for a long time, as alluded to in the expression "[keeping up with the Joneses](#)." Psychology researchers in recent decades have examined fear of missing out particularly in connection with social media.

For example, Mayank Gupta and Aditya Sharma, researchers in

psychiatry and neuroscience, respectively, define fear of missing out as a "phenomenon observed on social networking sites," that includes two processes of a "[perception of missing out, followed up with a compulsive behavior to maintain these social connections](#)."

While people may have been afraid of missing out long before social media, [social media now provides a way for us to check up on](#) what other people are doing and be hyper-aware of the things we may be missing out on.

Some psychologists have [conceptualized fear of missing out](#) on a scale, such that people can either assess themselves to be low or high in terms of this fear.

Research has shown [fear of missing out drives social media use](#) as a way of checking in on other people, and trying to relieve some of the anxiety of those with more fear experience about potentially missing out on things or being socially excluded.

Combatting FOMO in the pandemic

While we know that social [media](#) can play an important role in helping [youth](#) feel connected to others, for those who report more [fear](#) of missing out, it's possible that spending time online can intensify feelings of being left out—and increase feelings of social disconnection.

Our research suggests that an important question for parents is "What are you doing online and how is it making you feel?" over and above "How much time are you spending online?"

It's important for young people to think critically about what they are doing online and how it's making them feel. Connecting with others is great, but maybe passively scrolling through [social media](#) feeds is

actually increasing their feelings of missing out, and making them feel more disconnected.
