The fast-moving omicron variant may cause less severe disease on average, but COVID-19 deaths in the U.S. are climbing and modelers forecast 50,000 to 300,000 more Americans could die by the time the wave subsides in mid-March.

The seven-day rolling average for daily new COVID-19 deaths in the U.S. has been trending upward since mid-November, reaching nearly 1,700 on Jan. 17—still below the peak of 3,300 in January 2021. COVID-19 deaths among nursing home residents [started rising slightly two weeks ago](#), although still at a rate 10 times less than last year before most residents were vaccinated.

Despite signs omicron causes milder disease on average, the unprecedented level of infection spreading through the country, with cases still soaring in many states, means many [vulnerable people](#) will become severely sick. If the higher end of projections comes to pass, that would push total U.S. deaths from COVID-19 over 1 million by [early spring](#).

"A lot of people are still going to die because of how transmissible omicron has been," said University of South Florida epidemiologist Jason Salemi. "It unfortunately is going to get worse before it gets better."

Morgues are starting to run out of space in Johnson County, Kansas, said Dr. Sanmi Areola, director of the health department. More than 30 residents have died in the county this year, the vast majority of them unvaccinated.

Registered nurse Bryan Hofilena attaches "COVID Patient" stickers on a body bag of a patient who died of coronavirus at Providence Holy Cross Medical Center in Los Angeles, Dec. 14, 2021. But the notion that a generally less severe variant could still take the lives of thousands of people has been difficult for health experts to convey. The math of it—that a small percentage of a very high number of infections can yield a very high number of deaths—is difficult to visualize.

"Overall, you're going to see more sick people even if you as an

individual have a lower chance of being sick," said Katriona Shea of Pennsylvania State University, who co-leads a team that pulls together [several pandemic models](#) and shares the combined projections with the White House.

The wave of deaths heading for the United States will crest in late January or early February, Shea said. In early February, weekly deaths could equal or exceed the delta peak, and possibly even surpass the previous U.S. peak in deaths last year.

Some unknown portion of these deaths are among people infected with the delta variant, but experts say omicron is also claiming lives.

People wait in line at COVID-19 testing site in Times Square on Dec. 3, 2021, in New York. The fast-moving omicron variant may cause less severe disease on

average, but COVID-19 deaths in the U.S. are climbing and modelers forecast 50,000 to 300,000 more Americans could die by the time the wave subsides in mid-March. Credit: AP Photo/Yuki Iwamura, File

"This is omicron driven," Shea said of the coming wave of deaths. The combined models project 1.5 million Americans will be hospitalized and 191,000 will die from mid-December through mid-March. Taking into account the uncertainty in the models, U.S. deaths during the omicron wave could range from 58,000 to 305,000.

Yet, it's become increasingly clear that the risk from omicron is lower than from previous variants. New evidence from nearly 70,000 patients in Southern California suggests omicron is causing milder illness than delta.

A study, posted online and cited during a recent White House briefing, found patients with [omicron](#) had a 53% lower risk of hospitalization with respiratory symptoms, a 74% lower risk of ICU admission, and a 91% lower risk of [death](#). The study, which has not yet been peer reviewed, comes from researchers at Kaiser Permanente and University of California, Berkeley.

"It's hard for me to say straight out it's good news," said study co-author Sara Y. Tartof, a Kaiser Permanente research scientist. "Maybe there's good news in the sense that if you are infected your chance of becoming severely ill are decreased, but from a societal perspective it's a very heavy burden for us. It remains a serious situation, and we need to maintain practices and behaviors we know protect us."

People wait in line outside a COVID-19 walk-in testing site, Dec. 5, 2021, in Cambridge, Mass. The fast-moving omicron variant may cause less severe disease on average, but COVID-19 deaths in the U.S. are climbing and modelers forecast 50,000 to 300,000 more Americans could die by the time the wave subsides in mid-March. Overburdened hospitals could also contribute to more deaths, said Marc Lipsitch of Harvard T.H. Chan School of Public Health and scientific director of the Centers for Disease Control and Prevention's forecasting center.

"In places with extremely short staffing and overloads of patients, as the medical professionals have been telling us, the quality of care begins to suffer," Lipsitch said. "That may also lead to higher death rates, but

that's not in any of the models that I'm aware of."
