

Vitamin D supplementation could reduce migraine headache attacks

January 11 2022

(HealthDay)—Vitamin D supplementation could reduce headache

attacks per month and headache days per month among migraine patients, according to a review published in the December issue of *The American Journal of Emergency Medicine*.

Chen Hu, from the Chongqing Hospital of Traditional Chinese Medicine in China, and colleagues conducted a [systematic review](#) of randomized controlled [trials](#) exploring the effect of vitamin D for migraine patients. Data were included for six randomized controlled trials with 301 patients.

The researchers found that vitamin D supplementation could reduce headache attacks per month, headache days per month, and migraine disability assessment questionnaire scores (mean differences, -2.74 , -1.56 , and -5.72 , respectively) compared with controls, but it had no obvious effect on attack duration or headache severity.

"Our [analysis](#) is based on only six randomized controlled trials, and all of them have relatively small patient samples," the authors write. "We need more randomized controlled trials with large patient [samples] to explore this issue."
