Most people eat meat and dairy with little thought of the consequences. Yet those consequences are planetary in scale. Raising livestock for meat, eggs and milk accounts for [roughly 14%](#) of all man-made greenhouse gas emissions. Beef production is the [biggest driver](#) of forest loss within agriculture. The meat industry has been linked to a host of

other environmental harms, including water pollution.

Eating too much meat can be bad for your health too, particularly red and processed meat which is thought to increase your risk of developing colorectal cancer. Feeding the world's appetite for meat costs the lives of [billions of animals](#) a year, and [animal welfare](#) is a concern on farms worldwide, with [pigs](#), [cows](#) and [chickens](#) often subject to overcrowding, open wounds and disease.

Animal welfare laws in the UK [compare poorly](#) with standards set by organizations like [the RSPCA](#). Chickens are forced to grow much faster than they naturally would and become ill as a result, while narrow crates and tying posts restrict the movements of pigs and cows. In extreme cases, captive pigs have been found [engaging in cannibalism](#).

In what is no doubt a response to these concerns, veganism is on the rise. In the UK, the number of people eating a plant-based diet [increased fourfold](#) between 2014 and 2019. However, vegans still only make up about 1% of the UK population and [vegetarians just 2%](#). On a global scale, meat consumption is [actually increasing](#). So why do people keep eating meat, despite widespread awareness of the downsides?

Psychologists have some answers.

The meat paradox

[Our recent paper](#) reviewed 73 articles on a phenomenon called the [meat paradox](#)—the mental contradiction that helps devoted animal lovers continue [eating animals](#).

This [moral dilemma](#) can cause people psychological discomfort, and our review revealed [several triggers](#). For instance, you may relate to the jarring experience of realizing for the first time that the meat on your

plate came from an animal.

Meat-eating has consequences for how we interact with and perceive animals in later life, too. While eating beef in a 2010 study, participants were less likely to view animals as [worthy of moral concern](#). And the more committed someone is to eating meat, the more likely they are to avoid information about [the positive qualities](#) of animals raised for food.

The discomfort people feel about eating meat presents them with a stark choice. Either remove the moral dilemma by giving up meat, or continue eating meat and [morally disengage](#). Moral disengagement is when we [choose not to act](#) on our moral values. Our review highlighted several strategies that people use to maintain this [moral disengagement](#).

After being reminded that the meat on your plate comes from an animal, you may try to [forget its animal origins](#). People are more willing to eat meat when its animal origins are [obscured](#), such as by calling meat beef instead of cow. [Telling yourself](#) that meat is necessary for health, socially normal, natural or too nice to give up can reduce the guilt people feel when eating meat. Giving up meat can seem difficult and so people often turn to these strategies to reconcile conflicting feelings.

Overcoming moral disengagement

If you would like to reduce your own meat consumption, psychological research has a few recommendations.

- Recognize and remember how reducing your [meat consumption aligns with your values](#).
- Always keep animals in mind. Allow yourself to [humanize them](#) by considering their capacity for emotion, for example.
- Accept that changing your diet may be [a gradual process](#).
- If you want to encourage others to cut down on meat-eating, you

can:

- Avoid blaming them for their [meat](#) consumption. This only makes people [more resistant](#) to vegetarianism and veganism. Instead, approach these tricky interactions with compassion.
- Avoid telling other people [what to do](#). Let them make up their own minds.
- Humanize [animals](#) by encouraging people to view them instead as [friends and not food](#).
