

Mini-slings noninferior to mid-urethral slings for stress urinary incontinence in women

March 31 2022

Single-incision mini-slings are noninferior to mid-urethral slings for women with stress urinary incontinence, according to a study published in the March 31 issue of the *New England Journal of Medicine*.

Mohamed Abdel-Fattah, M.D., from the University of Aberdeen in the United Kingdom, and colleagues compared mini-slings to mid-urethral slings among women at 21 U.K. hospitals during 36 months of follow-up in a pragmatic, noninferiority, randomized trial. A total of 298 women were randomly assigned to receive mini-slings and 298 were randomly assigned to mid-urethral slings.

The researchers found that success was reported by 79.1 and 75.6 percent of patients in the mini-sling and mid-urethral sling groups, respectively, at 15 months (adjusted risk difference, 4.6 percentage points; 95 percent confidence interval [CI], -2.7 to 11.8; P

"Adjustable anchored mini-slings were noninferior to tension-free mid-urethral slings with respect to patient-reported success at 15 months, and the between-group difference remained similar at 36 months," the authors write.
