

Mexico confirms its first monkeypox case

May 29 2022

Mexican health officials have confirmed the country's first known case of monkeypox.

Health officials in Mexico confirmed Saturday the country's first known case of monkeypox, in a 50-year-old US resident being treated in Mexico City.

The man, a permanent resident of New York City, "was probably infected in the Netherlands," Hugo Lopez-Gatell, an undersecretary of health, said on Twitter.

"Fortunately, he is stable and in preventive isolation," Lopez-Gatell said. "We hope he will recover without complications."

He provided no information on the patient's possible contacts with other people.

On Friday, [health authorities](#) in Argentina confirmed the first two known cases of the disease anywhere in Latin America—those of a 40-year-old man who had returned to Argentina from Spain, and of a Spaniard who was visiting Buenos Aires.

The two cases apparently were unconnected.

The monkeypox virus can be transmitted to humans by infected animals. Person-to-person transmission is possible but rare.

Monkeypox is related to smallpox but is much less severe. Initial symptoms include a high fever, swollen lymph nodes and a chickenpox-like rash.

There is no specific treatment but vaccination against smallpox has been found to be about 85 percent effective in preventing monkeypox.

Monkeypox

Zoonotic viral disease

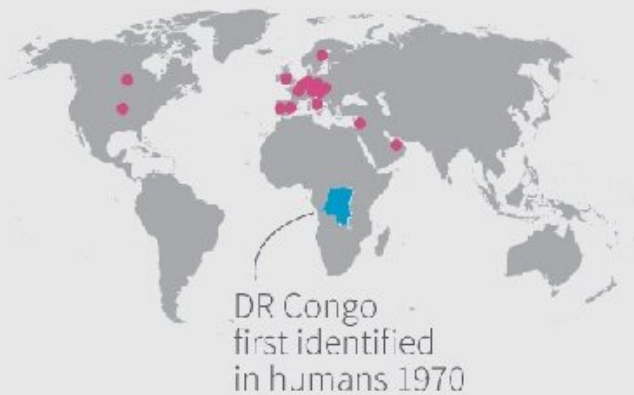

Current outbreaks

As of May 27

More than 200 confirmed cases worldwide since early May

Now detected in some 20 countries outside of West Africa where it is considered endemic

- *Countries with confirmed cases*

UNAIDS said “a significant proportion” of recent monkeypox cases have been identified among gay, bisexual and other men who have sex with men

But transmission is most likely via close physical contact and could affect anyone

Source: ECDC/WHO

Factfile on the current outbreak of monkeypox as dozens of cases of the rare disease are detected in North America, Europe and the Middle East.

Monkeypox was first detected in the Democratic Republic of Congo in 1970 and is considered endemic in around a dozen African countries.

Its appearance in non-endemic countries has worried experts, although those cases reported so far have been mostly mild and there have been no deaths.

There have been at least a half-dozen confirmed or suspected cases in the US.
