

Social dissatisfaction predicts vulnerability to financial exploitation in older adults

May 25 2022

Researchers who study elder abuse have long believed that when older adults face loneliness or relationship problems, they are more likely to

fall victim to monetary scams and exploitation. But the field has only studied the link retrospectively, looking back in time to see whether a connection exists, and has yet to establish a firm link.

Now, a team of researchers at the Keck School of Medicine of USC has collected longitudinal data showing that an increase in interpersonal dysfunction, defined as loneliness or dissatisfaction with relationships, predicts subsequent vulnerability to [financial exploitation](#). The results were just published in the journal *Aging & Mental Health*.

"To our knowledge, this is the first study showing that the quality of older adults' [interpersonal relationships](#) has an impact on their financial vulnerability at a later time," said the study's senior author, Duke Han, Ph.D., director of neuropsychology in the Department of Family Medicine and a professor of family medicine, neurology, psychology and gerontology at the Keck School of Medicine.

The findings underscore that [social connectedness](#), which is already known to enhance [physical health](#) and psychological wellbeing among older adults, may also be a key protector against financial abuse.

"This study points to a specific factor—[social functioning](#)—that could allow us to predict, and ultimately prevent, vulnerability to financial exploitation before it happens," said Aaron Lim, Ph.D., a postdoctoral fellow in Han's research lab and first author of the study.

A spike in vulnerability

The participants included 26 adults, aged 50 and older, with an average age of 65. At the beginning of the study, researchers evaluated each participant's overall health, cognitive functioning, depression and anxiety symptoms and prior history of financial exploitation and controlled for these factors in their statistical analyses.

Then, for six months, the researchers collected data at two-week intervals. They measured each participant's interpersonal dysfunction by asking how frequently they had argued with someone, felt rejected, felt lonely, wished their relationships were better and wished they had more friends. They also assessed participants' vulnerability to financial exploitation during the past two weeks with questions such as "how confident are you in making big financial decisions?" and "how often has someone talked you into a decision to spend or donate money that you did not initially want to do?"

"When a person reported a spike in problems within their [social circle](#) or increased feelings of loneliness, we were much more likely to see a corresponding spike in their psychological vulnerability to being financially exploited two weeks later," Lim said.

In addition to the effects within individuals, there was also a significant effect between participants: Those who had higher interpersonal dysfunction compared to other participants tended to report greater vulnerability to financial exploitation.

Preventing exploitation

The study's results offer insight into how to counteract common financial scams that target [older adults](#), including phishing emails, investment schemes and the "grandparent scam," where an older adult receives a call from someone about a grandchild in urgent need of money.

At the individual level, Lim suggests that people watch for social upsets in their parents' and grandparents' lives—such as the death of a close friend or an argument with a family member—as risk factors for financial vulnerability in the immediate future. At the community level, organizations that support seniors can also provide additional

opportunities for social connection.

Because the study's sample was small, the results need to be replicated in larger and more diverse samples, Han said. The research team also plans to build on the findings with a follow-up study to investigate the connection between social dysfunction and actual incidents of financial exploitation, not just vulnerability.
