

# US monkeypox cases continue to decline, but health officials worry about reaching minorities

September 15 2022, by Dennis Thompson HealthDay Reporter

---

[Monkeypox](#) cases continue to fall in the United States, but public health officials now are concerned that the virus is wending its way into communities of color.

New case numbers are down by nearly half since early August, White House monkeypox response coordinator Bob Fenton said in a Thursday media briefing.

Fenton credited the decrease in new cases to vaccinations and education efforts around the nation, noting that a [pilot program](#) targeting large Pride events has delivered nearly 11,000 doses of vaccine.

"In places like Atlanta, where we've worked closely with the public health community to surge vaccines and information around events like Black Pride, the rate of new cases has steadily declined," Fenton said. "In D.C., the new cases have declined 20%, on average, per week since they peaked in mid-July."

As of Sept. 14, there have been nearly 23,000 cases of monkeypox [identified](#) in the United States, out of more than 59,600 cases detected globally in 103 countries, Dr. Rochelle Walensky, director of the U.S. Centers for Disease Control and Prevention, said during the White House briefing.

But while the growth in new cases has declined overall, "over the past several weeks we have also seen the racial and ethnic makeup of this outbreak evolve," Walensky added.

Monkeypox cases are now "concentrating in gay, bisexual and other men who have sex with men of color," causing case counts to actually rise in certain parts of the United States even as they fall nationwide, said Dr. Demetre Daskalakis, deputy coordinator of the White House monkeypox response.

"While monkeypox cases were first seen predominantly in non-Hispanic white men, in the last week, among the cases for which we have race and ethnicity data, non-Hispanic Black men represented 38% of cases. Latino or Hispanic men represented 25% of cases, and non-Hispanic white men represented 26% of cases," Walensky said.

More than 540,000 doses of monkeypox vaccine have been administered so far, Walensky said, but [white people](#) have received the most doses.

"Those who are white represent about 47% of people who received their first dose. Those who are Hispanic represent about 21% and those who are Black represent about 12%," Walensky said, noting that those numbers are disproportionately lower than the race and ethnicity of new cases.

In response, the White House has opened up a new [monkeypox vaccine equity pilot program](#), aimed at expanding vaccine access to [communities of color](#) in places being hit hardest by the virus, Daskalakis said.

"It is critical that education, vaccinations, testing and treatment are equally accessible to all populations, but especially those most affected by ... this outbreak," Walensky said.

U.S. scientists are also continuing to research [monkeypox](#), in terms of transmission, testing and vaccines, said Dr. Anthony Fauci, director of the U.S. National Institute of Allergy and Infectious Diseases.

"As we implement the interventions that we have, simultaneously we still pursue some unanswered questions," Fauci said.

One clinical trial is focusing on intradermal administration of the [Jynneos vaccine](#), he said. By injecting the [vaccine](#) into the skin, doctors are able to stretch one vial into five doses. But this trial is also testing to

see if one vial could stretch to as many as 10 doses, Fauci noted.

"If in fact one to 10 works, that will immediately double the amount of doses available on an international scale," he said.
