Quitline treatment engagement by language preference. Credit: *The Annals of Family Medicine* (2022). DOI: 10.1370/afm.2878

Researchers conducted a study examining the differences in smoking treatment between Spanish- and English-preferring primary care patients linked with evidence-based tobacco treatment using Ask-Advise-

Connect (AAC). Researchers compared enrollment, engagement and smoking cessation outcomes.

Patients who received [treatment](#) in Spanish (vs. English) were twice as likely to be abstinent at six months. Receipt of nicotine replacement therapy (NRT) increased abstinence for all patients.

Language was not a factor in predicting abstinence through the use of NRT. The authors assert that automated point-of-care approaches such as AAC have great potential to reach Spanish-preferring smokers, who seem to appreciate treatment by those who speak the concordant language.

The research was published in *The Annals of Family Medicine*.
