Uganda on Thursday received its first shipment of trial vaccines against a strain of Ebola that has claimed dozens of lives, amid cautious optimism the outbreak could soon be over.

Since authorities declared an Ebola outbreak on September 20, the East African nation has registered 142 confirmed cases and 56 deaths, with the disease spreading to the capital Kampala.

The outbreak has been caused by the Sudan strain of the virus, for which there is currently no [vaccine](#).

But three candidate vaccines—one developed by Oxford University and the Jenner Institute in Britain, another from the Sabin Vaccine Institute in the United States, and a third from the International AIDS Vaccine Initiative (IAVI)—will be trialed in Uganda in the coming weeks.

"We are very excited that today Uganda has received 1,200 doses of one of the three [candidate vaccines](#) against the Sudan Ebola virus," Uganda's Health Minister Jane Ruth Aceng told AFP after the plane carrying the shipment touched down at Entebbe airport.

Ministry spokesman Emmanuel Ainebyoona said this first delivery contained doses from the Sabin Vaccine Institute.

They will be used in a so-called ring vaccination trial, where all contacts of confirmed Ebola patients, and contacts of contacts, are jabbed along with frontline and [health workers](#).

Ugandan authorities said last month that new cases were falling, and the last confirmed patient with the disease was discharged from hospital on November 30.

The World Health Organization's regional director for Africa, Matshidiso Moeti, told reporters on Thursday that Uganda had "begun the countdown to the end of the Ebola outbreak".

She hailed the arrival of the vaccines as "a promising step towards

possible protection against the virus".

According to WHO criteria, an outbreak of the disease ends when there are no new cases for 42 consecutive days—twice the incubation period of Ebola.

"There are 33 more days" to declare the end of the outbreak, said Yonas Tegegn Woldemariam, WHO representative in Uganda.

Since October 15, the authorities have imposed a lockdown on two districts at the epicentre of the [outbreak](#), with a dusk-to-dawn curfew, a ban on personal travel, and the closure of markets, bars and churches.

Ebola is spread through bodily fluids. Common symptoms are fever, vomiting, bleeding and diarrhoea.

Outbreaks are difficult to contain, especially in [urban environments](#).

The worst Ebola epidemic in West Africa between 2013 and 2016 killed more than 11,300 people.
