

Medication abortions are under fire: Here's how they work

March 15 2023, by LINDSEY TANNER and MATTHEW PERRONE

Bottles of abortion pills mifepristone, left, and misoprostol, right, at a clinic in Des Moines, Iowa, Sept. 22, 2010. Medication abortions became the preferred method for ending pregnancy in the U.S. even before the Supreme Court overturned *Roe v. Wade*. Now threatened by a federal court case in Texas, they usually involve taking two prescription medicines days apart — at home or in a clinic. Medication abortions became the preferred method for ending pregnancy in the U.S. even before the Supreme Court overturned *Roe v. Wade*. They usually involve taking two prescription medicines days apart—at home or in a clinic.

Abortion procedures are an invasive medical technique that empties the womb. They are sometimes called surgical abortions, although they don't involve surgery.

In the United States, abortions by pills usually involve the drugs mifepristone and misoprostol. As more [states](#) seek abortion limits, demand for the pills is expected to grow. But they have been targeted by abortion foes including Christian conservatives who filed suit in Texas seeking to overturn the Food and Drug Administration's approval of mifepristone. A hearing on the suit [was held Wednesday](#).

HOW THE DRUGS WORK

Mifepristone is taken first, swallowed by mouth. The drug dilates the cervix and blocks the effects of the hormone progesterone, which is needed to sustain a pregnancy.

Misoprostol, a drug also used to treat stomach ulcers, is taken 24 to 48 hours later. The [pill](#) is designed to dissolve when placed between the gums and teeth or in the vagina. It causes the uterus to cramp and contract, causing bleeding and expelling pregnancy tissue.

While the two-drug combination is slightly more effective, misoprostol is sometimes used alone for abortions. That practice is more common in countries where mifepristone is banned, but U.S. clinics were preparing to switch to the single drug if the lawsuit prevails.

HOW THE DRUGS ARE USED

Abortion medication is approved for use up to the 10th week of pregnancy.

The pills may be taken in a doctor's office or clinic, where patients sometimes have an ultrasound or lab tests beforehand. Some providers also offer the pills through telehealth visits and then send patients the medication by mail.

Use of the pills has been increasing in recent years and they account for more than half of all U.S. abortions.

SIDE EFFECTS

Studies and real-use evidence show that when taken together, the pills are safe and up to 99% effective. Side effects may include nausea, vomiting and diarrhea.

Bleeding is normal. Very heavy bleeding—soaking more than two pads an hour for more than two hours—is uncommon but requires medical attention.

Dr. Stephanie Rand, a New York ob-gyn and abortion specialist with the advocacy group Physicians for Reproductive Health, says pregnancy tests should not be used right away to determine if a medication abortion was successful because the pregnancy hormone may linger in the body for several weeks. Bleeding, with blood clots that include lighter colored tissue, are signs of success, she said.

Serious complications are very rare. The Food and Drug Administration says more than 3.7 million U.S. women have used mifepristone since it was approved more than 20 years ago. The agency has received 26 reports of deaths in women using the medication, including two involving ectopic pregnancies, which grow outside the womb.

The medications are not recommended for certain patients, including those with suspected ectopic pregnancies or with implanted IUD birth control devices.

COSTS

Costs vary by location but are similar to abortion procedures and may total more than \$500. Health insurance coverage varies, with some plans making the pills free or low cost and others not covering them at all.

Mifepristone is sold under the brand name Mifeprex and misoprostol under the brand name Cytotec, but both pills are available as generics.

FEDERAL RULES

The FDA approved mifepristone to terminate pregnancy in 2000, when used with misoprostol. At the time, it imposed several limits on how the drug could be prescribed and dispensed.

In December, the agency dropped the biggest restriction: a requirement that patients pick up the medication in person. The FDA said a scientific review of the drug's use—including during the COVID-19 pandemic—showed that women could safely receive the pills through the mail after an online consultation, without any increase in side effects or complications.

The decision allowed mail delivery of the pills nationwide, a change long-sought by medical professional groups and abortion-rights supporters. Still, millions of women will have trouble accessing the pills due to a patchwork of [state laws](#) targeting abortion broadly and the pills specifically.

About half of U.S. states are expected to ban or greatly restrict abortion.

LEGAL CONFLICTS

Legal experts foresee years of court battles over access to the pills, as abortion-rights proponents bring test cases to challenge state restrictions.

There are strong arguments and precedents on both sides, experts note, though little certainty about which side might prevail.

The Biden administration's Justice Department has already signaled plans to challenge state restrictions on medication abortion. And federal lawyers are likely to be joined by outside parties, including abortion rights groups like Planned Parenthood and even the companies that make the pills.

The chief argument against pill restrictions is likely to be the longstanding principle that federal laws, including FDA decisions, preempts state laws. Indeed, few states have ever tried to fully ban an FDA-approved drug because of past rulings in the agency's favor.

Still, states with blanket abortion bans are likely to interpret them as barring abortion pills. Many of the laws don't distinguish between abortion procedures and medication abortion.

"In the short term, those states that ban abortion are going to assume that their bans also include medication abortion and that will be prohibited," said Greer Donley, a professor specializing in reproductive health care at the University of Pittsburgh Law School.

STATE LAWS ON THE PILLS

Even if blanket bans are successfully challenged, 15 states have limited access to abortion pills, including six that require an in-person physician visit. Those laws could withstand court challenges. States have long had

authority over how physicians, pharmacists and other providers practice medicine.

States also set the rules for telemedicine consultations used to prescribe medications. Generally that means health providers in states with restrictions on abortion pills could face penalties, such as fines or license suspension, for trying to send [pills](#) through the mail.

Women have already been traveling across state lines to places where abortion pill access is easier. That trend is expected to increase.

Meanwhile, some women will still get the medication via online pharmacies in Canada and overseas, often with telehealth consultations from foreign doctors. The practice is technically illegal but essentially unenforced, and advocates believe women will increasingly choose this method as more states move to ban abortions.

"Anti-abortion states are going to do everything they can to restrict [medication](#) abortion, but practically speaking people have been and will continue to access it through the mail from international pharmacies," Donley said.

YEARS OF UNCERTAINTY

Donley expects lawsuits based on various legal theories to play out for a few years before any clear decisions emerge.

One key question is how the nation's top court might rule if and when it takes up those court cases. While the Supreme Court has rejected a constitutional right to [abortion](#), conservative justices have also generally deferred to FDA's primacy over drug decisions.
