Older adults who entered skilled nursing facilities (SNF) for care after hospitalizations after the pandemic received rehabilitation care comparable to the levels of care that were provided pre-pandemic, according to research published in the *JAMA Health Forum*.

Despite exceptional challenges during the pandemic, SNFs provided post-acute rehabilitation with only a modest decline in intensity, said the researchers. This suggests that SNFs were largely able to adapt and provide post-acute care rehabilitation to [older adults](#).

"During the pandemic we knew that fewer people went to skilled nursing facilities after hospitalizations, and it seemed like the ones that went were overall sicker, with more [cognitive impairment](#) and higher risk overall," said Sandra M. Shi, MD, MPH.

"This study helps to demonstrate that despite caring for a sicker population with scarce resources, SNFs were still largely able to provide post-acute rehabilitation for patients."

"Our goal was to characterize changes in [rehabilitation services](#) provided by SNFs during COVID-19", said Sarah Berry, MD, MPH.

"Rehabilitation services overall decreased, but only by about a half day on average."
