

How creativity is possible through response inhibition

April 12 2023

Recognizing and controlling our emotions is crucial to enhance our creativity. Researchers around Dr. Radwa Khalil, a Neuroscience

Researcher at Constructor University in Bremen, recently found out how our response inhibition skill facilitates the effects of negative emotions on creative thinking. The results have been published in the *Creativity Research Journal* this week.

In order to complete a task or achieve a goal, humans can block their automatic or pre-potent reactions using the mental skill known as response inhibition. It entails operating in a more controlled and deliberate manner as opposed to responding to impulses, inclinations, or habits. Response inhibition is characterized by behaviors like refraining from checking one's phone during a meeting or refraining from responding aloud to a question in class without being asked.

Thinking creatively can be significantly impacted by emotions. Although previous studies highlighted the effects of [emotional states](#) on creativity, the interactions between specific affective, emotional states, and response inhibition remain elusive. "Our current study extends our understanding of the distinct mechanisms of specific emotional states on divergent [creative thinking](#) and the associated responses in the context of response inhibition," Khalil explained. "Our data revealed that response [inhibition](#) mediates the effect of negative affect and fatigue and in fact, enhanced psychophysiological arousal on divergent thinking."

People can unlock their creative potential and reach new heights of achievement by embracing irritation and using it as a tool to inspire fresh ideas and methods. This assumption can lead to interesting implications for the application of potential strategy-based findings in practice, such as education, industry, and politics, particularly when creativity and innovation are necessary. Nevertheless, creativity tasks are rarely systematically compared, therefore, further research is required in this respect.

While experiencing dissatisfaction can be frustrating, it can also be a

strong catalyst for invention and [creativity](#). "To sum up, we must encounter unpleasant consequences, but if we handle them differently and turn them into a motivator for our persistence, we may unleash our creative potential," said Khalil.
