

Dietary supplements used by most adults, one-third of kids: Survey

April 18 2023, by Cara Murez

Taking vitamins may drain your wallet without helping your health, yet a

new government survey shows most American adults take them, as do about one-third of children.

Researchers who were led by Suruchi Mishra, from the U.S. National Center for Health Statistics, [found](#) vitamin use was common from 2017 to March 2020, prior to the pandemic when vitamin use may have even increased.

"It's promoted as a natural product. It's promoted as something that is different than what you're going to get from your doctor, and the notion is that there's no side effects because it's all natural, and therefore it can only do good and can never do harm," Dr. Paul Offit, a doctor at Children's Hospital of Philadelphia, told CNN. "You can't beat that," added Offit, who is also the author of *Do You Believe in Magic? Vitamins, Supplements, and All Things Natural: A Look Behind the Curtain*.

In reality, there is "[insufficient evidence](#)" to recommend for or against taking a multivitamin with folic acid, antioxidant combination vitamins or individual supplements for vitamins A, C or E to prevent cancer or [heart disease](#) in someone who is healthy but not pregnant, according to the [U.S. Preventive Services Task Force](#) (USPSTF).

An exception may be vitamin D: Offit said it is thought to improve bone health by helping the body absorb calcium and phosphorous.

Vitamin D can be consumed through certain foods, but most people don't eat enough salmon, tuna or fortified milk and [orange juice](#) to get the right amount, CNN reported. The sun can also provide a dose of vitamin D, but not for everyone, including people with darker skin or older adults.

The minimum daily recommendation of vitamin D is 10 micrograms

(mcg) up to age 1, 15 mcg up to age 70 and 20 mcg for adults 71 and older, CNN reported.

Another important supplement is [folic acid](#) for [pregnant women](#), who should supplement with 400 to 800 mcg daily. The [task force recommends](#) this for preventing neural tube defects in babies.

Other supplements, such as beta carotene, may be harmful. The USPSTF said there is a possible higher risk of mortality, cardiovascular mortality and lung cancer in those who take it.

Offit recommends telling your doctor if you're taking any [vitamin supplements](#).

"I think people don't think of them as medicines. But some of them can interfere with therapies like a medicine can, including chemotherapies," Offit said. "It's really important for doctors to know what you are taking."
