

Poor social determinants of health tied to vision loss

April 11 2023, by Lori Solomon

Social determinants of health (SDOH), across multiple domains, are

associated with vision loss, according to a study published online April 6 in *JAMA Ophthalmology*.

Katelin M. Alfaro Hudak, Ph.D., from NORC at the University of Chicago, and colleagues examined associations between SDOH and examination-based and self-reported vision loss. The analysis included data from more than 3.6 million individuals across three national surveys.

The researchers found that SDOH across five domains of economic stability, [educational attainment](#), [health care access](#) and quality, neighborhood and built environment, and social context were significant predictors of poor vision.

Among three [data sets](#), for example, higher income was associated with lower odds of [vision loss](#) (poverty-to-income ratio: odds ratio [OR], 0.91 and 0.93; categorical income [
