At the end of 2022, the federal government eliminated the "X waiver," a major hurdle to providing addiction treatment, but progress needs to be continued, according to the authors of a new Perspective piece published

in the *New England Journal of Medicine*.

The X waiver required a special license and uncompensated training for physicians and other prescribers, creating a regulatory barrier to offering lifesaving buprenorphine treatment for opioid use disorder. Ending the X, the authors write, is necessary but not sufficient to achieve overdose-prevention goals.

Sarah Wakeman, MD, Medical Director for Substance Use Disorder at Mass General Brigham, and her co-author Leo Beletsky, JD, MPH, University of California, San Diego School of Medicine, call for several additional measures to expand access. These include:

- Mainstreaming addiction education: Rather than the 8-hour training the Drug Enforcement Administration is now requiring of all clinicians who prescribe controlled substances, incorporate education about addiction during medical school, residency, and other [training programs](#).
- Expanding methadone access: Rethinking methadone regulations, including transitioning stable patients to office-based care with general practitioners.
- Investing in the [addiction treatment](#) workforce: Federally fund training programs, including addiction medicine fellowship programs for physicians and training in addiction programs for nurse practitioners, social workers, and mental health counselors.

"The X waiver was one example of an onerous and unnecessary barrier to a lifesaving intervention, but there are many others, including methadone regulations and policies obstructing access to harm-reduction services," said Wakeman. "We believe the [federal government](#) should continue its important progress in expanding access to medication for [substance use disorder](#) by rethinking methadone regulations."
