

Clinical trial: Daily beetroot juice reduces rate of repeat procedures, heart attacks in angina patients with stents

Drinking beetroot juice every day for six months after having a stent fitted reduced the chance of angina patients having a heart attack or

needing a repeat procedure, according to new research presented at the British Cardiovascular Society conference.

The finding on the benefits of the vegetable [juice](#) comes from a trial by the National Institute for Health and Care Research and the British Heart Foundation (BHF), presented at the conference in Manchester.

The researchers, based at St Bartholomew's Hospital and Queen Mary University in London, found that 16 percent of angina patients had a serious heart or circulatory incident, like a heart attack or need for another procedure, in the two years after having a stent fitted. However, when patients had [beetroot juice](#) daily, this dropped to 7.5 percent.

Thousands of [coronary heart disease](#) patients each year in the UK have a stent implanted to widen one of the blood vessels in their heart and ease their angina, in a procedure known as a [percutaneous coronary intervention](#) (PCI).

Around 10 percent of patients experience restenosis, where the stented blood vessel narrows again and heart disease symptoms return, within five years of a PCI. By advising that patients drink beetroot juice, doctors could soon reduce the chance that the stent fails in this way.

When the blood vessel width of patients was measured six months after stenting, the vessels of those who had beetroot juice showed around half as much narrowing in that time as those who had the placebo treatment.

By stopping restenosis, beetroot juice could stop patients from having to have another PCI procedure that may also fail or a much more invasive coronary bypass surgery.

Dr. Krishnaraj Rathod, Clinical Senior Lecturer at the William Harvey Research Institute, QMUL, who led the trial, said, "Experiments in the

lab suggested that the inorganic nitrate, which is found naturally in beetroot juice, would have these effects, and it is very encouraging to see it create such a big improvement in the clinic for angina patients. Our patients liked that their treatment was a completely natural product that has no significant side effects."

"We will now take this to the next stage of trials in the hope that doctors can soon prescribe beetroot juice to ensure stents last longer to provide even more effective relief of symptoms."

Professor James Leiper, Associate Medical Director at the British Heart Foundation, said, "Stenting is one of the most crucial tools we have in the fight against coronary heart disease but work still needs to be done to ensure that every patient sees a long-term benefit from the procedure."

"Thousands of patients each year have to go through the stress of a medical procedure on their heart more than once before it is successful. This small study offers hope that this can be prevented. The trial must now be scaled-up to confirm the initial observation that beetroot juice can make a difference."

The researchers were able to show that beetroot juice helps patients thanks to its natural high level of inorganic nitrate. Patients in the trial that had beetroot juice with inorganic nitrate removed did not get the same beneficial effects.

Inorganic nitrate is a nutrient that gets converted to nitrite by naturally found bacteria in the mouth, which is then turned into the signaling molecule nitric oxide (NO) by enzymes in the body. It is thought that NO is the cause of the positive effects on patients' [blood vessels](#).

Beetroot juice was shown to be a safe and reliable way to get [inorganic nitrate](#) into the body, with no significant side effects experienced by any

of the 300 patients on the trial other than pink urine.

The team are now looking to start a larger trial soon. They are hoping that, if successful, [beetroot](#) juice can be prescribed as a treatment to be taken after stent implantation. This may then extend beyond angina patients to those who have had a stent for a different reason, like after a [heart attack](#).
