

Pediatricians' group urges that all infants get new RSV shot

August 16 2023, by Cara Murez

All infants should receive the new long-acting preventive monoclonal

antibody for respiratory syncytial virus (RSV), the nation's leading pediatrics group said.

The American Academy of Pediatrics (AAP) urged that access to the new medication, called nirsevimab, be equitable.

RSV is common, contagious and sometimes deadly, the AAP said.

The antibody boosts the immune system.

The new medication may not be immediately available in all [clinical settings](#). For that reason, the AAP also recommended continued use of another monoclonal antibody product, palivizumab, during the upcoming RSV season for children at high risk of severe illness.

"Pediatricians are sadly familiar with the dangers of RSV and its devastating consequences for some families," AAP President [Dr. Sandy Chung](#) said in an academy news release. "We are eager to offer all [infants](#) this protection and urge [federal officials](#) to see that it is made available and affordable in all communities."

The U.S. Food and Drug Administration approved nirsevimab under the brand name Beyfortus.

It is also recommended by the U.S. Centers for Disease Control and Prevention.

Clinical trials found that nirsevimab reduces the risk of RSV requiring medical care by 75%. All infants younger than 8 months born during or entering their first RSV season should receive a single dose of nirsevimab, the AAP said.

Infants and children aged 8 through 19 months who are at increased risk

of severe RSV disease and entering their second RSV season should also receive a single dose.

Eligible infants and children who cannot access nirsevimab should instead receive palivizumab, which includes a series of monthly doses.

RSV season in the United States typically begins in late fall. It continues through spring.

Recommendations will be updated as needed, the AAP said.

The AAP is calling for a comprehensive strategy to ensure equitable access in hospitals, birthing centers and other medical practices. Chung called the lack of access to the product for all children "alarming."

The AAP is concerned that families living in [lower-income](#) and under-resourced communities and infants who are at greatest risk for severe RSV illness may face challenges accessing the medication.
