

Testosterone treatment does not cut fracture incidence in men with hypogonadism

January 18 2024, by Elana Gotkine

Testosterone treatment does not result in a lower incidence of clinical fractures among middle-aged and older men with hypogonadism, according to a study published in the Jan. 18 issue of the *New England*

Journal of Medicine.

Peter J. Snyder, M.D., from the Perelman School of Medicine at the University of Pennsylvania in Philadelphia, and colleagues examined the risk for clinical fracture in a time-to-event analysis subtrial of a randomized placebo-controlled trial that evaluated the cardiovascular safety of [testosterone treatment](#) in middle-aged and [older men](#) with hypogonadism. Eligible men were aged 45 to 80 years with preexisting, or a high risk for, [cardiovascular disease](#); one or more symptoms of hypogonadism; and two morning testosterone concentrations
