Over the past two decades, immunotherapy—utilizing the body's own immune system to combat illness—has emerged as a groundbreaking treatment for various types of cancer. The body's own T-cells possess a remarkable capacity to identify and fight a wide range of cancers. Regrettably, cancer cells frequently develop the ability to weaken the activity of T-cells.

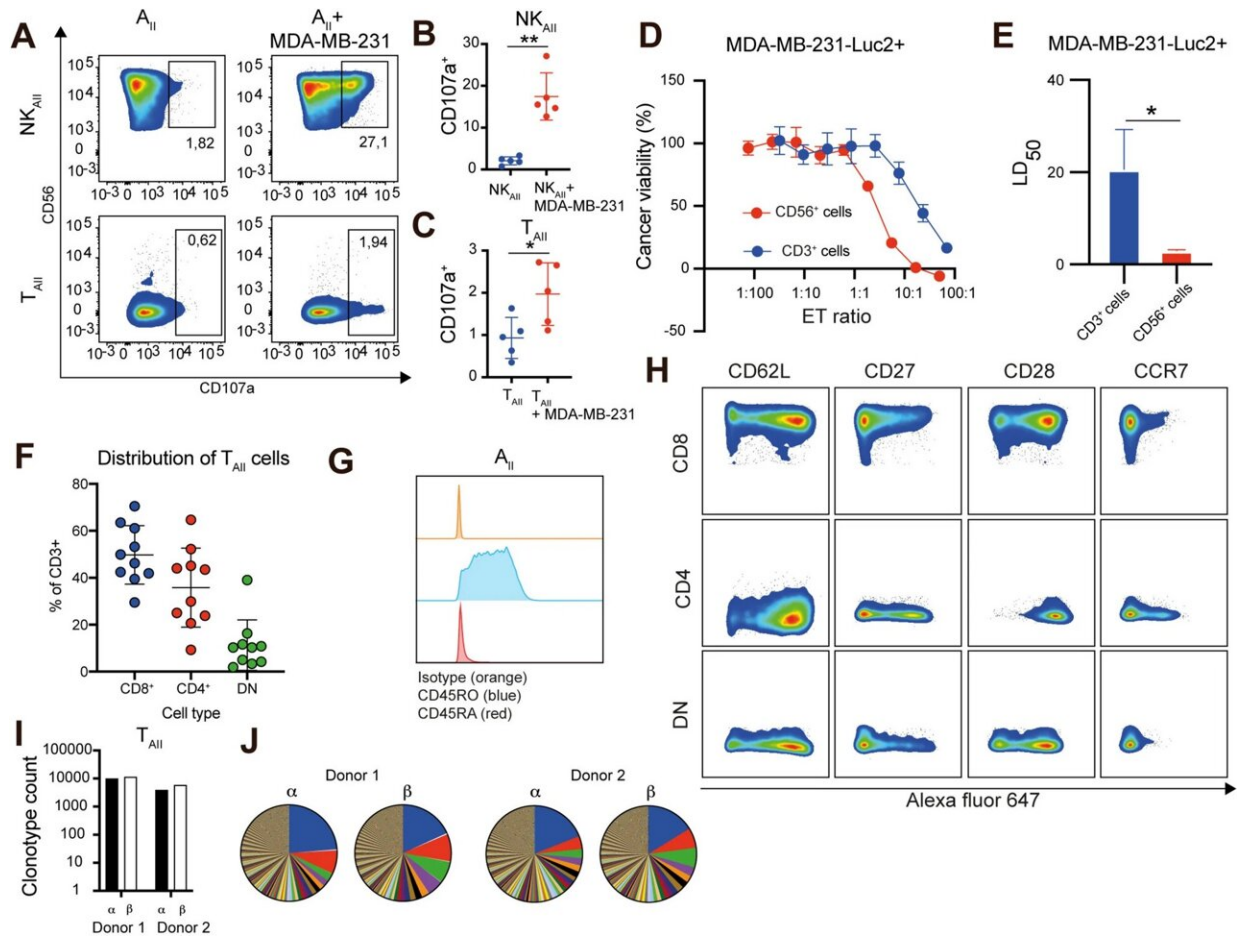

"We already have several drugs that inhibit the weakening of T-cells, but even the most effective drugs vary greatly in effect depending on the type of cancer being treated," explains Odd Gammelgaard, one of the researchers behind the study [published](#) in *Molecular Cancer*.

A limiting factor in the use of these drugs is the requirement for patients to have sufficient numbers of so-called reactive T-cells that can distinguish between healthy and diseased cells, which is often not the case. To address this, technologies have been developed that enable the selection and cultivation of T-cells in the laboratory.

Cultivated from the patients' blood

The Danish biotech company CytoVac has developed a new technology where they draw the patients' own blood and then isolate and mature T-cells in a laboratory setting. These lab-cultivated T-cells are subsequently reintroduced into the patients.

In a new study, researchers from the University of Southern Denmark and Odense University Hospital, in collaboration with CytoVac, have shown that if the lab-cultivated T-cells are administered in combination with drugs that prevent [cancer cells](#) from inhibiting the T-cell activity, the effect against the cancer is significantly increased. It can inhibit [tumor growth](#), prevent the spread of cancer, and significantly prolong survival in animal models.

A_{II} consists of phenotypically novel T cells with cancer-eradicating capacity. **A** Degranulation analysis of A_{II} upon 5 h culture alone, or with MDA-MB-231 cells, demonstrating degranulation of both NK_{AII} and T_{AII} cells. A representative of five experiments is shown. **B-C** Quantification of the degranulation of NK_{AII} and T_{AII} upon co-culture with MDA-MB-231 cells from five independent experiments presented as mean ± SD. **D** Cancer cell viability analysis (luminescence) following 24-h co-culturing with purified immune cell fractions. A representative of seven independent experiments is shown. Data is presented as mean ± SEM of triplicates. **E** Comparison of the LD₅₀ from the data presented in **D**. **F** Comparison of percentage of CD4⁺, CD8⁺, and DN T_{AII} cells in 10 A_{II} preparations evaluated by flow cytometry. **G** Flow cytometry analysis of A_{II} cells showing expression of CD45RO, but not CD45RA. **H** Phenotypic analysis of CD4⁺, CD8⁺ and DN T_{AII} cells with regard to CD62L, CD27, CD28 and CCR7 expression determined by flow cytometry **I-J** TCR clonotype analysis

identifying thousands of TCR alpha and beta chains in each A_{II} preparation. Preparations are dominated by 10–20 T cell clones. Statistical difference was determined using the paired t-test B-C and the Student's t-test E. *0.05 > P ≥ 0.01, **0.01 > P ≥ 0.001. Credit: *Molecular Cancer* (2024). DOI: 10.1186/s12943-023-01914-8

Positive outcomes, but clinical use will take time

Initially, the treatment has been tested on animals with the breast cancer subtype called triple-negative breast cancer. This type makes up about 10% of all breast cancer cases. It's known for having few effective treatment options and lower survival rates compared to other breast cancers.

"In the long term, we aim to offer this combination treatment to patients with [triple-negative breast cancer](#). The only requirement for the patient to receive this treatment would be repeated blood donations. We expect that the the combination treatment also will have an effect in other types of cancer, but this remains to be established."

"The first step from here is to test whether we can achieve the same findings in humans who receive the treatment. It is a lengthy process, so it is too early to say when and if patients will benefit from this new combined treatment," says Gammelgaard.
