

Treatment with N-acetyl-L-leucine beneficial for Niemann-Pick disease

February 1 2024, by Elana Gotkine

Treatment with N-acetyl-L-leucine (NALL) for 12 weeks yields better neurological status than placebo among patients with genetically confirmed Niemann-Pick disease type C, according to a study published in the Feb. 1 issue of the *New England Journal of Medicine*.

Tatiana Bremova-Ertl, M.D., Ph.D., from the University Hospital Bern in Switzerland, and colleagues randomly assigned 60 patients age 4 years or older with genetically confirmed Niemann-Pick disease type C to receive 12 weeks of NALL followed by 12 weeks of placebo or to receive 12 weeks of placebo followed by 12 weeks of NALL in a 1:1 ratio.

The researchers found that the mean change from baseline in the Scale for the Assessment and Rating of Ataxia [total score](#) was -1.97 ± 2.43 and -0.60 ± 2.39 points after 12 weeks of receiving NALL and placebo, respectively (least-squares mean difference, -1.28 points). For the secondary end points, the results were generally supportive of the findings in the primary analysis; however, these were not adjusted for multiple comparisons. A similar incidence of adverse events was seen with NALL and placebo; there were no treatment-related serious adverse events reported.

"In this phase 3 trial involving [patients](#) with Niemann-Pick disease type C, [treatment](#) with NALL reduced neurologic signs and symptoms as compared with [placebo](#) over 12 weeks," the authors write.
