

Research highlights STON2 variations involved in synaptic dysfunction and schizophrenia-like behaviors

April 10 2024

STON2^{307Pro851Ala} knockin mice exhibited deficits in synaptic function and schizophrenia-like behaviors, which could be restored by haloperidol administration. Credit: Science China Press

Schizophrenia is a severe mental disorder characterized by positive symptoms, negative symptoms, and cognitive deficits, with heritability

estimates of approximately 80%. Synaptic dysfunction is a core component of the pathophysiology of schizophrenia. However, the genetic risk factors and molecular mechanisms related to synaptic dysfunction are still not fully understood.

Clathrin-mediated endocytosis (CME) plays a crucial role in synaptic vesicle trafficking, and it has been hypothesized that CME impairment contributes to neuropathology related to [schizophrenia](#). A study [published](#) in the journal *Science Bulletin* found that the C-C (307Pro-851Ala) haplotype of STON2 increases susceptibility to schizophrenia in the Chinese Han population, and these variations cause schizophrenia-like behaviors in mice through the regulation of CME.

The researchers revealed that schizophrenia-related STON2 variations led to protein dephosphorylation, which affected the interaction of the protein with synaptotagmin 1 (Syt1), a calcium sensor protein located in the presynaptic membrane that is critical for CME. STON2^{307Pro851Ala} knockin mice exhibited deficits in [synaptic transmission](#), short-term plasticity, and schizophrenia-like behaviors.

Moreover, Pharmacogenomic data revealed that patients with the C-C (307Pro-851Ala) haplotype responded better to haloperidol, and haloperidol administration restored the schizophrenia-related behaviors of STON2^{307Pro851Ala} knock in mice through the regulation of Syt1 sorting and synaptic transmission.

The findings demonstrated the effect of schizophrenia-related STON2 variations on CME and synaptic function, which might be attractive therapeutic targets for treating schizophrenia-like phenotypes.

This study was led by Prof. Jun Li (Peking University Sixth Hospital), Prof. Dai Zhang (Peking University Sixth Hospital), Dr. Yuanlin Ma (Peking University Sixth Hospital; The First Affiliated Hospital of

Chongqing Medical University), and Dr. Kai Gao (Peking University Sixth hospital; Changping Laboratory).
