

# Study finds hospital-onset SARS-CoV-2 infection during omicron linked to morbidity

During the omicron era, hospital-onset severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection remained associated with increased morbidity and mortality, according to a study [published](#)

online July 16 in the *Annals of Internal Medicine*.

Michael Klompas, M.D., M.P.H., from Harvard Medical School and the Harvard Pilgrim Health Care Institute in Boston, and colleagues estimated the effect of nosocomial SARS-CoV-2 infection on hospitalized patients' outcomes during the pre-omicron and omicron eras.

Hospital mortality and time to discharge were assessed as primary outcomes among adults testing positive for SARS-CoV-2 on or after hospital day 5, after negative SARS-CoV-2 test results on admission and on hospital day 3, and matched control participants.

Data were included for 274 cases of hospital-onset SARS-CoV-2 infection during the pre-omicron period and 1,037 cases during the omicron period (0.17 and 0.49 cases per 100 admissions, respectively). The researchers found that compared with those without, patients with hospital-onset SARS-CoV-2 were older and had more comorbid conditions.

During the pre-omicron period, compared with control participants, hospital-onset SARS-CoV-2 infection was associated with an increased risk for [intensive care unit](#) (ICU) admission, an increased need for high-flow oxygen, longer time to discharge (median difference, 4.7 days), and higher mortality (risk ratio, 2.0).

During the omicron period, an increased risk for ICU admission and increased time to [discharge](#) (median difference, 4.2 days) were still seen in association with hospital-onset SARS-CoV-2. The association with increased [hospital mortality](#) was still significant, although attenuated (risk ratio, 1.6).

"The frequency and persistent morbidity associated with hospital-onset

SARS-CoV-2 infections in the [omicron](#) era suggest that hospitals should implement measures to prevent nosocomial SARS-CoV-2 infections," the authors write.
