

Cheap, safe device helps avoid premature birth

3 April 2012

A simple low-cost silicon ring can slash the risk of premature birth, a major cause of death in newborns and health problems in adult life, according to a trial reported on Tuesday by *The Lancet*.

Spanish doctors tested the 38 euro (\$49.50) device, known as a pessary, on women in their last three months of pregnancy who had cervical shortening, a condition that weakens the [pelvic floor](#) and leads to pre-term birth.

The pessary is designed to strengthen the cervix -- the lower end of the uterus that leads to the vagina -- so that it can cope with the extra weight of the final weeks of pregnancy.

Silicon pessaries have been used over the past 50 years as one of several methods to prevent pre-term births.

But their effectiveness has been debated, and this was the first time the device had been investigated in a [randomised trial](#).

Six percent of women who were fitted with the pessary gave birth prematurely, compared to 27 percent of counterparts who did not have the device, according to the study.

The so-called PECEP trial recruited 15,000 women who underwent [ultrasound examination](#) in five hospitals when they were in between 20 and 23 weeks of pregnancy.

Of these, 380 had cervical shortening -- defined as a having a cervix whose length was 25mm (0.98 inches) or less -- and were randomly assigned to one of two groups, each comprising 190 women.

In the pessary group, 12 had a baby before 34 weeks of pregnancy, while the number in the non-pessary group was 51.

No side effects were reported in the pessary group, and 95 percent of its participants said they would recommend the treatment for others.

"Placement of a pessary is an affordable procedure, non-invasive and easy to insert and remove as required," said lead researcher Maria Goya, an [obstetrician](#) at the Vall d'Hebron University Hospital in Barcelona.
