

Flu shot did poor job against worst bug in seniors

21 February 2013, by Mike Stobbe

Health officials say this season's flu shot is only 9 percent effective in protecting seniors against the most common and dangerous flu bug.

Flu vaccine tends to protect younger people better than older ones and is never 100 percent effective. But experts say the preliminary results released Thursday are disappointing and highlight the need for a better vaccine.

For all age groups, the vaccine's effectiveness was a moderate 56 percent.

But it did a particularly poor job of protecting those 65 and older against a harsh [flu strain](#) that is causing most of the illnesses this year. Health officials emphasize that some protection though is better than none at all.

The [flu season](#) started early this year but the worst of it is over.
