

Team explores broader definition of successful aging

20 May 2014

An aging population poses challenges for governments around the globe as nations grapple with how to satisfy the physical, social and economic needs of older adults. About 126 million adults 65 years and older live in China - the country with the largest population of senior citizens, while 40 million adults 65 years and older live in the United States.

In an article published today in *Journal of Transcultural Nursing*, University of Louisville School of Nursing assistant professor Valerie Lander McCarthy, PhD, RN; Ji Hong, MSN, a visiting scholar from Shandong University, China; and Jiyong Ling, PhD, MS, RN, post-graduate fellow, Michigan State University College of Nursing, explore whether a broader definition of successful aging could positively influence research, clinical practice and health policy in the United States and China.

McCarthy argues it is unrealistic to measure positive aging solely on good physical and cognitive function and active social engagement, as traditionally defined by J. W. Rowe, M.D., and Robert L. Kahn.

"In reality the definition applies to only about 10-percent of the older adult population, then [older adults](#) feel guilty when they get sick because they think they are not succeeding – and in the U.S. succeeding is important. In China, individual success is not as important, but the negative effect of the cost to care for the older population is a major problem," McCarthy said.

Even in the presence of chronic illness and functional limitations, older adults still report aging successfully, McCarthy said. She concludes nurse scientist Meredith Flood's definition is most accurate. Flood describes successful aging as a person's ability to cope and adapt while maintaining a sense of connectedness and meaning in life.

Building on Flood's ideas, McCarthy's own studies have found transcendence - a sense of meaning, well-being and life satisfaction, to be the best predictor of positive aging. The concept involves relationships, creativity, contemplation, introspection and spirituality. Thanks to a grant from the nursing honor society Sigma Theta Tau International and the National Gerontological Nurses Association, she is working to develop a program of activities to increase transcendence.

An example of one intervention involves a time for quiet solitude in natural beauty followed by a discussion about a person's outlook, helping to develop a broadened perspective on life or a feeling of being an integral part of the cycle of life. A second example may provide an opportunity for storytelling, increasing a sense of belonging to a group.

"Successful aging is important for the rapidly growing population of older adults and their families and caregivers," McCarthy said. "It also is significant for society as a whole, which will bear the burden of unprecedented demands on health and social services. This is one reason we are developing interventions to increase positive aging."
