

Weedkiller likely cause of Nigeria 'mystery disease': WHO

19 April 2015

Pesticide poisoning was the likely cause of the mysterious deaths of at least 18 people in a southwestern Nigerian town earlier this week, the World Health Organization said Sunday.

The "current hypothesis is cause of the event is herbicides", WHO spokesman Gregory Hartl said in a Tweet.

"Tests done so far are negative for viral and [bacterial infection](#)," he added.

The victims began showing symptoms early last week in what Ondo state spokesman Kayode Akinmade called a "mysterious disease", prompting fears of a new [infectious disease outbreak](#) in a region ravaged by Ebola.

The victims, whose symptoms included headache, weight loss, blurred vision and loss of consciousness, died within a day of falling ill in the town of Ode-Irele, in southwestern Ondo state.

The Ondo state health commissioner, Dayo Adeyanju, told AFP Saturday that 23 people had been affected.

Akinmade said health officials and experts from the government and aid agencies, as well as WHO epidemiologists, had arrived in Ode-Irele to investigate the deaths.

The tests were carried out at the Lagos University Teaching Hospital, the WHO said.
