

# Brazil reports 5,909 microcephaly cases since October 2015

2 March 2016

---

Brazil's Health Ministry says it's received reports of 5,909 cases of microcephaly since the Zika virus outbreak started in October. But only 641 of those have been confirmed so far.

The ministry's latest figures show 1,046 of the reported cases have been discarded and the remaining 4,222 cases are still being investigated.

Microcephaly is a rare defect that causes newborns to have unusually small heads and damaged brains.

Before the outbreak, authorities said that on average Brazil had about 150 reported cases a year, though some investigators think the actual number of cases was far greater.

Researchers are trying to determine if Zika is linked to [microcephaly](#), which also can be caused by factors such as syphilis, [rubella](#) or toxoplasmosis.

There had been 5,640 total reported cases last week.
