

# Rifaximin effective for repeat treatment of IBS with diarrhea

27 December 2016

but not for stool consistency ( $P = 0.42$ ). There were also significant improvements for prevention of recurrence, durable response, and [bowel movement](#) urgency. The groups had similar adverse event rates.

"In a phase 3 study of patients with relapsing symptoms of IBS-D, repeat rifaximin treatment was efficacious and well tolerated," the authors write.

Several authors disclosed financial ties to Salix Pharmaceuticals, which manufactures rifaximin and funded the study.

(HealthDay)—Repeat treatment with the nonsystemic antibiotic rifaximin is effective in patients with relapsing symptoms of diarrhea-predominant irritable bowel syndrome (IBS-D), according to a study published in the December issue of *Gastroenterology*.

Anthony Lembo, M.D., from the Beth Israel Deaconess Medical Center in Boston, and colleagues conducted a multicenter, phase 3, randomized, placebo-controlled trial to evaluate the safety and efficacy of repeat [treatment](#) with the nonsystemic antibiotic rifaximin (550 mg three times daily for two weeks) among 636 adults with IBS-D, mean [abdominal pain](#) and bloating scores of 3 or more, and loose stool (February 2012 through June 2014).

The researchers found that the percentage of responders was significantly greater with rifaximin than placebo ( $P = 0.03$ ). For abdominal pain, the percentage of responders ( $P = 0.018$ ) was significantly greater with rifaximin versus placebo,
