

Infidelity can be forgiven—but at a cost

Infidelity is very common. At least 20 per cent of couples - and perhaps many more, depending on where you set the limit - are unfaithful to their spouse.

Being forgiven for [infidelity](#) is simply not easy. But many people whose spouse forgives them mistrust the signals and do not really believe that they are forgiven, according to a new study from NTNU.

"We have a strong tendency not to believe our [partner](#) when they tell us we are forgiven," says Mons Bendixen, Associate Professor in the Department of Psychology.

Overcompensate

Free of charge infidelity is not, because possible forgiveness comes at a considerable cost. A large part of this cost we bring upon ourselves.

When you do not really believe you are forgiven, even if your partner asserts that you are, you will overcompensate.

You may become more attentive, buy gifts or do other things that you expect your partner will appreciate. Underestimating the degree of forgiveness is probably an evolutionary mechanism, because the relationship may be in danger.

"The cost could be high if you think you are forgiven, but really are not. You might not work hard enough to mend the relationship," says Bendixen.

Better safe than sorry, it is better to make a little extra effort rather than do too little. Regardless, the consequences are usually uncomfortable for the unfaithful party. Your partner takes it for granted that you believe what he or she says to be true.

Advantageous to be wrong

In this case, it may be to your advantage to be wrong. The Error Management Theory (EMT), a theory of evolved perceptual errors, can help explain why. (See fact box.)

When interpreting signals, we can make one of two false assumptions: we can believe that something exists even if it doesn't, and we can believe that something doesn't exist even if it does.

From an evolutionary perspective, it's a question of which errors are more adaptable.

"An example is men who think women are interested in sex, even though the women's intention is just to be nice. The most important thing for men in situations like this is not to miss a sexual opportunity," says Bendixen.

Similarities between the sexes

Most partners aren't particularly intent on getting

revenge or seeing their partner suffer. That doesn't mean that it never happens, but the probability is the same for both sexes.

They are more likely to pull away and want to keep some distance.

"Partners want the infidelity to have a cost, but will rarely respond by being unfaithful themselves," says evolutionary psychologist Trond Viggo Grøntvedt in NTNU's Department of Public Health and Nursing.

There is also no difference between the sexes when it comes to whether they would break up with the unfaithful partner or not. This is as likely for women as for men.

The sexes agree on a lot when it comes to infidelity. But one exception exists.

Did I do something wrong?

"Men often do not understand how hard emotional infidelity is on women," says Professor Leif Edward Ottesen Kennair in the Department of Psychology.

Sexual infidelity strongly affects both men and women. Neither men nor women usually find it acceptable for their partner to have sex outside the marriage.

But say you meet someone at a party and dance and flirt with the person there. Later you meet that person multiple times without telling your partner, but you don't have sex. A friend of your partner finds out, and even reports that you look like you are in love. Is this wrong?

Women find this scenario much worse than men do.

"Many men do not see this as infidelity at all, since they did not have sex with the other woman," said Kennair.

Is this a problem? Well yes, maybe.

Men forgive more often

Men who are confronted with emotional infidelity do not necessarily think that they have done anything wrong. As a result, they do not attempt to make up for anything, at least not as much as if they had been sexually unfaithful. This certainly does not benefit the relationship.

"It can also be a seed for conflict in the relationship," says Kennair.

At the same time, men are more likely to forgive this form of infidelity in their spouse. Men have less need to distance themselves from their partner than women do, and they look at emotional infidelity as less threatening to the relationship than women do.

The same with jealousy

This matches up with the psychologists' predictions. Previously, they investigated jealousy reactions in women and men around the suspicion of imminent infidelity. Many of the same patterns were found in that study.

Women become most jealous at the thought of their partner being emotionally unfaithful, whereas men become most jealous in the case of [sexual infidelity](#).

This is again entirely in line with the evolutionary theory of parental investment. For most women, it has historically and evolutionarily been worse for them if their partner breaks up than it has been for most men.

Becoming emotionally attached to someone other than themselves has therefore been more threatening to [women](#) than to men.

Clear gender differences

Researchers conducted the survey with 92 heterosexual couples. These were young students who answered questions about imagined sexual or [emotional infidelity](#) by their partner and themselves.

Whether these responses would apply to all heterosexual relationships is of course a question. Those asked were young, perhaps inexperienced and idealistic, starting their adult lives, so they

could more easily find a new partner than others, and we can assume they knew they would talk to each other about the answers afterwards.

But the conditions were the same for both sexes, and gender differences are nevertheless clear.

Infidelity is named as the most common cause of divorces in Norway, although other reasons often other underlie it. Women initiate divorce much more often than men do.
