

Abdominal obesity linked to lower urinary tract symptoms

6 July 2018

In a recent LUTS study, men with central (or abdominal) obesity were at increased risk of experiencing lower urinary tract symptoms, and increased waist-to-hip ratio was associated with worsened straining and weak stream.

The study included 2,917 men from the Fangchenggang Area Male Healthy and Examination Survey in China.

The authors noted that [lower urinary tract symptoms](#) are highly prevalent in both aging men and women, and the relationship with obesity is controversial.
