A low-calorie diet causes different metabolic effects in women than in men, a new *Diabetes, Obesity and Metabolism* study suggests.

In the study of more than 2,000 [overweight individuals](#) with pre-diabetes who followed a low-calorie diet for 8 weeks, men lost significantly more body weight than [women](#), and they had larger reductions in a metabolic syndrome score, a diabetes indicator, fat mass, and heart rate. Women had larger reductions in HDL-cholesterol, [hip circumference](#), lean body mass (or fat free mass), and pulse pressure than men.

"Despite adjusting for the differences in [weight loss](#), it appears that men benefitted more from the intervention than women. Whether differences between genders persist in the long-term and whether we will need to design different interventions depending on gender will be interesting to follow," said lead author Dr. Pia Christensen, of the University of Copenhagen, in Denmark.

"However, the 8-week low-energy diet in
