Study designs novel approach for better understanding teens and technology
18 February 2020, by Emily Kumlien

To develop this scale, several steps were used to identify common interests and interactions on social media, including a convening with experts in the field and review with teens themselves. Once the preliminary survey was created, a total of 761 adolescents between the age of 12 to 18 took this online survey. The survey asked respondents to rate the importance of using social media for different reasons, including:

- to provide an important accomplishment or update on your life using social media
- to plan an event
- to post a photo for artistic reasons
- to manage your mood
- to video chat
- to build a brand

After analyzing the data and validating the survey, they identified three subscales representing general categories of importance for teens:

1. Technology to bridge online/offline experience and preferences. This subscale includes items such as posting about an accomplishment or updating your life using social media or looking for an event to attend. These types of interactions represent teens sharing something about their offline life to the online world, or connecting to a business they use offline by following them online.

2. Technology to go outside one's offline identity. This subscale includes an individual using social media to manage their mood, creating a new profile with a different identity, or using a digital tool that creates or transports them to a virtual environment.

3. Technology for social connection. This subscale includes items such as having a video chat, seeing what people are up to without asking them about it (checking their profile or feed) and contributing to a private
"We hope this new scale impacts the field of adolescents digital technology research. For some time now there has been healthy skepticism for studies that focus on minutes. We hope to advance our ability to provide information and education to teens and families by considering the quality of their children's technology use and not just quantity," said Moreno.
